

## **GRUBER**

GRUBER is planned to work on mobile apps. The team is planning to implement a web site that would be accessible through laptop and desktop computers later.

Firstly the mobile app will be released and the web page will be released afterwards.

1. How long might this project take, and which approach to the SDLC would be most appropriate?
2. If you use a predictive SDLC, how much time might each phase of the project take? How much overlap of phases might you plan for? Be specific about how you would overlap the phases.
3. If you use an adaptive SDLC, how many iterations might you plan to include? What use cases would you analyze, design, and implement in the first iteration? What use cases would you work on in the second iteration? In additional iterations? Think in terms of getting the core functionality implemented early and then building the supporting functionality.
